Preface

Metrics to evaluate “translational success” in clinical research provide general incentive structures that determine what learning goal may or may not be achieved by optimizing the success rate of Translational Research. “Information gain per capita of accepted research burdens” is a concept introduced to further think about how the current regulatory oversight system learns from past clinical R&D efforts (work in progress).

Open peer-review is enabled using [hypothes.is](#). This facilitates sentence-by-sentence annotation from readers directly on this page.

Chapter 1

Introduction

Previous work: - (Kimmelman and London 2015)

Chapter 2

Diving In

Now let's talk details.

Chapter 3

Multi-Criteria Decision Analysis
